

Experiment-3

Student Name: Ritika Bora UID: 23BCS12926

Branch: CSE Section/Group: KRG-3B

Semester: 5th Date of Performance: 22/08/25

Subject Name: ADBMS Subject Code: 23CSP-333

1. Aim:

Department Salary Champions Explorer

In a bustling corporate organization, each department strives to retain the most talented (and well-compensated) employees. You have access to two key records: **one lists every employee along with their salary and department**, **while the other details the names of each department**. Your task is to identify the **top earners in every department**.

If multiple employees share the same highest salary within a department, all of them should be celebrated equally. The final result should present the **department name**, **employee name**, **and salary of these top-tier professionals** arranged by department.

Merging Employee Histories: Who Earned Least? (Hard)

Two legacy HR systems (A and B) have separate records of employee salaries. These records may overlap. Management wants to **merge these datasets** and identify **each unique employee** (by EmpID) along with their **lowest recorded salary** across both systems.

Objective

- 1. Combine two tables A and B.
- 2. Return each EmpID with their lowest salary, and the corresponding Ename.

2. Objective:

- To understand and implement sub-queries in SQL.
- To identify the top earners in each department using correlated sub-queries.
- To practice handling scenarios where multiple employees share the same maximum salary.
- To merge datasets from multiple sources using UNION ALL.
- To apply GROUP BY with aggregate functions (MAX, MIN) for meaningful reporting.
- To retrieve the lowest recorded salary for each employee across different systems.
- To develop practical problem-solving skills for analytical database queries.

3. DBMS Script:

```
USE KRG 3B;
--EXPERIMENT 03: Department Salary Champions Explorer (MEDIUM LEVEL)
CREATE TABLE department (
  id INT PRIMARY KEY,
  dept name VARCHAR(50)
CREATE TABLE employee (
  id INT,
  name VARCHAR(50),
  salary INT,
  department id INT,
  FOREIGN KEY (department id) REFERENCES department(id)
);
INSERT INTO department (id, dept name) VALUES
(1, 'IT'),
(2, 'SALES');
INSERT INTO employee (id, name, salary, department id) VALUES
(1, 'JOE', 70000, 1),
(2, 'JIM', 90000, 1),
(3, 'HENRY', 80000, 2),
(4, 'SAM', 60000, 2),
(5, 'MAX', 90000, 1);
SELECT (SELECT dept name FROM department d where d.id = e.department id) AS
DEPT NAME, name, salary
FROM Employee e
WHERE salary IN (SELECT MAX(e2.salary) FROM employee e2 WHERE e2.department id =
e.department id);
```

--EXPERIMENT 03: Merging Employee Histories: Who Earned Least? (Hard)

CREATE TABLE A(empid integer, Ename VARCHAR(20), Salary INTEGER); CREATE TABLE B(empid integer, Ename VARCHAR(20), Salary INTEGER);

INSERT INTO A VALUES (1,'AA',1000), (2,'BB',300);

INSERT INTO b VALUES (2,'BB',400), (3,'CC',100);

SELECT EMPID,Max(ENAME) AS ENAME,MIN(SALARY) AS SALARY FROM(
SELECT * FROM A
UNION ALL
SELECT * FROM B
) AS INTERMEDIATE_RESULT
GROUP BY empid;

4. Output:

Output 1:

| ⊞ Results | | | | | |
|-----------|-----------|-------|--------|--|--|
| | DEPT_NAME | name | salary | | |
| 1 | SALES | HENRY | 80000 | | |
| 2 | IT | MAX | 90000 | | |
| 3 | IT | JIM | 90000 | | |
| | | | | | |

Output 2:

| ⊞ Results | | | | |
|-----------|-------|-------|---------|--|
| | EMPID | ENAME | ESALARY | |
| 1 | 1 | AA | 1000 | |
| 2 | 2 | BB | 300 | |
| 3 | 3 | CC | 100 | |

5. Learning Outcomes:

- Successfully implemented sub-queries to extract top salary earners by department.
- Practiced combining two datasets with UNION ALL.
- Used GROUP BY and aggregate functions (MAX, MIN) to derive meaningful insights.
- Understood how to merge historical records and identify minimum salaries.
- Strengthened SQL querying skills for analytical use cases.
